ضوابط النشر: بيشترط في البحوث العلمية المقدمة للنشر أن يراعى فيها ما يأتي : - أصول البحث العلمي وقواعده . - ألا تكون المادة العلمية قد سبق نشر ها أو كانت جزءا من رسالة علمية . - يرفق بالبحث تزكية لغوية وفق أنموذج معد . - تعدل البحوث المقبولة وتصحح وفق ما يراه المحكمون . - التزام الباحث بالضوابط التي وضعتها المجلة من عدد الصفحات ، ونوع الخط ورقمه ، والفترات الزمنية الممنوحة للتعديل ، وما يستجد من ضوابط تضعها المجلة مستقبلا . - المجلة الحق في تعديل البحث أو طلب تعديله أو رفضه . - المجلة الحق في تعديل البحث أو طلب تعديله أو رفضه . - المجلة الحق في النشر لأولويات المجلة وسياستها . - البحوث المنشورة تعبر عن وجهة نظر أصحابها ، ولا تعبر عن وجهة نظر المجلة .

Information for authors

1- Authors of the articles being accepted are required to respect the regulations and the rules of the scientific research.

2- The research articles or manuscripts should be original and have not been published previously. Materials that are currently being considered by another journal or is a part of scientific dissertation are requested not to be submitted.

3- The research articles should be approved by a linguistic reviewer.

4- All research articles in the journal undergo rigorous peer review based on initial editor screening.

5- All authors are requested to follow the regulations of publication in the template paper prepared by the editorial board of the journal.

Attention

1- The editor reserves the right to make any necessary changes in the papers, or request the author to do so, or reject the paper submitted.

2- The research articles undergo to the policy of the editorial board regarding the priority of publication.

3- The published articles represent only the authors' viewpoints.

A New Application of Sawi Transform for Solving Ordinary differential equations with Variable Coefficients

Hisham Zawam Rashdi¹, Mohammed E. Attaweel² Department of Mathematics, Faculty of Arts and Sciences, Kasr Khiar. Elmergib University, Libya hzrashdi@elmergib.edu.ly¹, meattaweel@elmergib.edu.ly²

Abstract: In this paper, a new integral transform was applied to solve ordinary differential equations with variable coefficients.

Keywords: Sawi Transform, Ordinary Differential Equations with variable coefficients.

Introduction: Ordinary differential equations (ODE) are one of the most important fields of mathematical sciences. especially applied mathematics. They have many types including ODE with constant coefficients and ODE with variable coefficients. These days, ODE with variable coefficients are widely used in astronomy, physics and engineering mathematics [6]. Sometimes, solving this type of equations is complicated but integral transforms play a big role in solving such equations [1], [4] & [5]. In addition to that, integral transforms have become an important tool to deal with problems in applied mathematics, statistics. theoretical mechanics. mathematical physics and pharmacokinetics [4], [5] & [6]. The most important attraction of these transforms is providing the analytical and exact solution of the problem without complicated calculations. Recently, Mahgoub in [1] introduced a new integral transform called Swai transform.

The main purpose of this paper is to show the applicability and efficiency of this transform for solving some ordinary differential equations with variable coefficients.

1. DEFINITION OF SAWI TRANSFORM [1], [2], [3] & [7]

If we have a real function (t); $t \ge 0$, then Sawi Transform is known as proposed in [1] by the following integral equation:

$$S\{G(t)\} = \frac{1}{p^2} \int_0^\infty \quad G(t) e^{-\frac{t}{p}} dt = g(p).$$
(1)

Here, S is called the Sawi Transform operator and p is real parameter. The Sawi transform of the function G(t) for $t \ge 0$ work out if G(t) is piecewise continuous and of exponential order. These two conditions are the only sufficient conditions for the existence of Sawi Transform of the function G(t).

2. Sawi Transform and Inverse Sawi Transform of Some Functions [2]

S. No.	G(t)	$S{G(t)} = g(p)$	g(p)	$G(t) = S^{-1}\{g(p)\}$
1	1	$\frac{1}{p}$	$\frac{1}{p}$	1
2	t	1	1	t
3	t^2	2! p	p	$\frac{t^2}{2!}$
4	t^n ; $n \in N$	$n! p^{n-1}$	$p^{n-1}; n \in N$	$ \frac{\overline{2!}}{\frac{t^n}{n!}} $
5	t^n ; $n > -1$	$\Gamma(n+1)p^{n-1}$	$p^{n-1}; n > -1$	$\frac{t^n}{\Gamma(n+1)}$
6	e ^{at}	$\frac{a}{p(1-ap)}$	$\frac{a}{p(1-ap)}$	e ^{at}
7	sin sin at	$\frac{a}{1+a^2p^2}$	$\frac{1}{1+a^2p^2}$	sin sin at a
8	cos cos at	$\frac{1}{p(1+a^2p^2)}$	$\frac{1}{p(1+a^2p^2)}$	cos cos at
9	sinh sinh at	$\frac{a}{1-a^2p^2}$	$\frac{1}{1-a^2p^2}$	sinh sinh at a
10	cosh cosh at	$\frac{1}{p(1-a^2p^2)}$ $\frac{n! p^{n-1}}{n! p^{n-1}}$	1	cosh cosh at

Table (1): Sawi transform and inverse Sawi transform of some functions.

3. Fundamental Properties of Sawi Transform [2]

Table (2): fundamental properties of Sawi Transform.

S. No.	The Property	Mathematical Form
1	Linearity	$S\{lG_1(t) + mG_2(t)\} = lS\{G_1(t)\} + mS\{G_2(t)\}$
2	Change of Scale	$S\{G(at)\} = ag(ap)$
3	Shifting	$S\{e^{at}G(t)\} = \left(\frac{1}{1-ap}\right)^2 g\left(\frac{p}{1-ap}\right)$
4	First Derivative	$S\{G'(t)\} = \frac{1}{p}g(p) - \frac{1}{p^2}G(0)$
5	Second Derivative	$S\{G''(t)\} = \frac{1}{p^2}g(p) - \frac{1}{p^3}G(0) - \frac{1}{p^2}G'(0)$
6	nth Derivative	$S\{G^{(n)}(t)\} = \frac{1}{p^n}g(p) - \frac{1}{p^{n+1}}G(0) - \frac{1}{p^n}G'(0) - \frac{1}{p^n}G'(0) - \frac{1}{p^2}G^{(n)}(0).$
7	Convolution	$S\{G_1(t) * G_2(t)\} = p^2 S\{G_1(t)\}S\{G_2(t)\}$

1. Sawi Transform of the Function $tG(t) \& t^2G(t)$:

If
$$S{G(t)} = g(p)$$
 then:
i. $S{tG(t)} = p^2 \frac{d}{dp}g(p) + 2pg(p)$.

Proof. Since,
$$S\{G(t)\} = \frac{1}{p^2} \int_0^\infty G(t) e^{-\frac{t}{p}} dt = g(p)$$

 $\therefore \frac{d}{dp} g(p) = \frac{d}{dp} \left(\frac{1}{p^2} \int_0^\infty G(t) e^{-\frac{t}{p}} dt \right)$
 $= \frac{-2}{p^3} \int_0^\infty G(t) e^{-\frac{t}{p}} dt + \frac{1}{p^2} \int_0^\infty \frac{t}{p^2} G(t) e^{-\frac{t}{p}} dt$
 $= \frac{-2}{p} g(p) + \frac{1}{p^2} S\{tG(t)\}$
 $\Rightarrow S\{tG(t)\} = p^2 \frac{d}{dp} g(p) + 2pg(p) =$
 $\frac{d}{dp} [p^2 g(p)].$ (2)

ii. $S\{t^2G(t)\} = p^2 \left[p^2 \frac{d^2}{dp^2} g(p) + 6p \frac{d}{dp} g(p) + 6g(p) \right].$ *Proof.* Since, $S\{tG(t)\} = p^2 \frac{d}{dp} g(p) + 2gp(p)$, so putting tG(t) instead of G(t) yields:

http://tarbawej.elmergib.edu.ly

$$S\{t, tG(t)\} = p^{2} \frac{d}{dp} S\{tG(t)\} + 2pS\{tG(t)\}$$
$$= p^{2} \frac{d}{dp} \left[p^{2} \frac{d}{dp} g(p) + 2pg(p) \right] + 2p \left[p^{2} \frac{d}{dp} g(p) + p^{2} \frac{d}{dp} g(p) \right]$$

2*pg*(*p*)

$$= p^{4} \frac{d^{2}}{dp^{2}} g(p) + 2p^{3} \frac{d}{dp} g(p) + 2p^{3} \frac{d}{dp} g(p) + 2p^{2} g(p) + 2p^{3} \frac{d}{dp} g(p) + 4p^{2} g(p)$$
$$= p^{4} \frac{d^{2}}{dp^{2}} g(p) + 6p^{3} \frac{d}{dp} g(p) + 6p^{2} g(p)$$

$$\therefore S\{t^2 G'(t)\} =$$

$$p^2 \left[p^2 \frac{d^2}{dp^2} g(p) + 6p \frac{d}{dp} g(p) + 6g(p) \right]. \tag{3}$$
2. Sawi Transform of the Functions $tG'(t) \& t^2 G'(t)$:

If $S{G(t)} = g(p)$ then:

i.
$$S\{tG'(t)\} = p \frac{d}{dp}g(p) + g(p) - \frac{d}{dp}G(0).$$

Proof. Since, $S\{G'(t)\} = \frac{1}{p}g(p) - \frac{1}{p^2}G(0)$, so in (2) put G'(t) instead of G(t), therefore:

$$S\{tG'(t)\} = p^{2} \frac{d}{dp} S\{G'(t)\} + 2pS\{G'(t)\}$$

$$= p^{2} \frac{d}{dp} \left[\frac{1}{p} g(p) - \frac{1}{p^{2}} G(0)\right] + 2p \left[\frac{1}{p} g(p) - \frac{1}{p^{2}} G(0)\right]$$

$$= p^{2} \left[-\frac{1}{p^{2}} g(p) + \frac{1}{p} \frac{d}{dp} g(p) + \frac{2}{p^{3}} G(0) - \frac{1}{p^{2}} \frac{d}{dp} G(0)\right] + 2g(p) - \frac{2}{p} G(0)$$

$$= -g(p) + p \frac{d}{dp} g(p) - \frac{d}{dp} G(0) + 2g(p)$$

$$\therefore S\{tG'(t)\} = p \frac{d}{dp} g(p) + g(p) - \frac{d}{dp} G(0) = \frac{d}{dp} [pg(p) - G(0)]$$
(4)

G(0)]. (4)
ii.
$$S\{t^2G'(t)\} = p\left[p^2\frac{d^2}{dp^2}g(p) + 4p\frac{d}{dp}g(p) + 2g(p)\right] - \frac{d}{dp}\left[p^2\frac{d}{dp}G(0)\right].$$

Proof. In the same way as before, we get: $S\{t.tG'(t)\} = p^2 \frac{d}{dp} S\{tG'(t)\} + 2pS\{tG'(t)\}$

$$= p^{2} \frac{d}{dp} \left[p \frac{d}{dp} g(p) + g(p) - \frac{d}{dp} G(0) \right] + 2p \left[p \frac{d}{dp} g(p) + g(p) - \frac{d}{dp} G(0) \right]$$

$$= p^{2} \frac{d}{dp} g(p) + p^{2} \frac{d}{dp} g(p) + p^{3} \frac{d^{2}}{dp^{2}} g(p) - p^{2} \frac{d^{2}}{dp^{2}} G(0) + 2pg(p) + 2p^{2} \frac{d}{dp} g(p) - 2p \frac{d}{dp} G(0)$$

$$= 4p^{2} \frac{d}{dp} g(p) - 2p \frac{d}{dp} G(0)$$

$$= 4p^{2} \frac{d}{dp} g(p) + p^{3} \frac{d^{2}}{dp^{2}} g(p) + 2pg(p) - \frac{d}{dp} \left[p^{2} \frac{d}{dp} G(0) \right]$$

$$\therefore S\{t^{2}G'(t)\} = p \left[p^{2} \frac{d^{2}}{dp^{2}} g(p) + 4p \frac{d}{dp} g(p) + 2g(p) \right] - \frac{d}{dp} \left[p^{2} \frac{d}{dp} G(0) \right]. \quad (5)$$
3. Sawi Transform of the Functions $tG''(t) \& t^{2}G''(t)$:
If $S\{G(t)\} = g(p)$ then:
i. $S\{tG''(t)\} = \frac{d}{dp} g(p) - \frac{1}{p} \frac{d}{dp} G(0) + \frac{1}{p^{2}} G(0) - \frac{d}{dp} G'(0).$
Proof. Since, $S\{G''(t)\} = \frac{1}{p^{2}} g(p) - \frac{1}{p^{3}} G(0) - \frac{1}{p^{2}} G'(0)$, therefore in (2) put $tG''(t)$ instead of $G''(t)$ which gives us:
 $S\{tG''(t)\} = p^{2} \frac{d}{dp} S\{G''(t)\} + 2pS\{G''(t)\}$

$$= p^{2} \frac{d}{dp} \left[\frac{1}{p^{2}} g(p) - \frac{1}{p^{3}} G(0) - \frac{1}{p^{2}} G'(0) \right] + 2p \left[\frac{1}{p^{2}} g(p) - \frac{1}{p^{3}} G(0) - \frac{1}{p^{2}} \frac{d}{dp} G'(0) + \frac{2}{p^{3}} G'(0) \right]$$

$$\therefore S\{tG''(t)\} = \frac{d}{dp} g(p) - \frac{1}{p^{3}} G(0) - \frac{1}{p^{3}} G'(0) - \frac{1}{p^{2}} G'(0) \right]$$

$$\therefore S\{tG''(t)\} = \frac{d}{dp} G(0) + \frac{1}{p^{2}} G(0) - \frac{d}{dp} G'(0) - \frac{d}{dp} G'(0) + \frac{2}{p^{3}} \frac{d}{dp} G(0) + \frac{1}{p^{2}} \frac{d}{dp} G'(0) - \frac{1}{p^$$

Proof. Since, $S\{tG''(t)\} = \frac{d}{dp}g(p) - \frac{1}{p}\frac{d}{dp}G(0) + \frac{1}{p^2}G(0) - \frac{d}{dp}G'(0)$, with the same way as before, we get: $S\{t^2G''(t)\} = p^2\frac{d}{dp}S\{tG''(t)\} + 2pS\{tG''(t)\}$

http://tarbawej.elmergib.edu.ly

$$= p^{2} \frac{d}{dp} \left[\frac{d}{dp} g(p) - \frac{1}{p} \frac{d}{dp} G(0) + \frac{1}{p^{2}} G(0) - \frac{d}{dp} G'(0) \right] + 2p \left[\frac{d}{dp} g(p) - \frac{1}{p} \frac{d}{dp} G(0) + \frac{1}{p^{2}} G(0) - \frac{d}{dp} G'(0) \right] \\= p^{2} \frac{d^{2}}{dp^{2}} g(p) + 2p \frac{d}{dp} g(p) - p^{2} \frac{d^{2}}{dp^{2}} G'(0) - 2p \frac{d}{dp} G'(0) - p \frac{d^{2}}{dp^{2}} G(0) \\\therefore S\{t^{2} G''(t)\} = \frac{d}{dp} \left[p^{2} \frac{d}{dp} g(p) \right] - \frac{d}{dp} \left[p^{2} \frac{d}{dp} G'(0) \right] - p \frac{d^{2}}{dp^{2}} G(0).$$
(7)
Therefore, we can summarize the above work in table (3):

the above work can sum table (\mathbf{S}) nari

S. No.	F(t)	$S{F(t)}$
1	t ⁿ e ^{at}	$\frac{n! p^{n-1}}{(1-ap)^{n+1}}$
2	tG(t)	$p^2 \frac{d}{dp}g(p) + 2pg(p)$
3	$t^2G(t)$	$p^2 \left[p^2 \frac{d^2}{dp^2} g(p) + 6p \frac{d}{dp} g(p) + 6g(p) \right]$
4	tG'(t)	$p\frac{d}{dp}g(p) + g(p) - \frac{d}{dp}G(0)$
5	$t^2G'(t)$	$p\left[p^2\frac{d^2}{dp^2}g(p) + 4p\frac{d}{dp}g(p) + 2g(p)\right] - \frac{d}{dp}\left[p^2\frac{d}{dp}G(0)\right]$
6	tG''(t)	$\frac{d}{dp}g(p) - \frac{1}{p}\frac{d}{dp}G(0) + \frac{1}{p^2}G(0) - \frac{d}{dp}G'(0)$
7	$t^2 G^{\prime\prime}(t)$	$\frac{d}{dp}\left[p^2\frac{d}{dp}g(p)\right] - \frac{d}{dp}\left[p^2\frac{d}{dp}G'(0)\right] - p\frac{d^2}{dp^2}G(0)$

Table (3): Sawi Transform of other functions.

Note 1: In the same way posed in the previous paragraphs, we can calculate Sawi Transform of functions $t^n G^{(n)}(t)$; $n \in N$.

Applications

Example (1): Solve the differential equation: ty'' - ty' - y = 0with the initial condition y(0) = 0 & y'(0) = 2.

Solution: Taking Sawi transform to both sides of given equation to give us:

 $S\{ty''\} - S\{ty'\} - S\{y\} = 0.$ $\frac{d}{dn}S\{y\} - \frac{1}{n}\frac{d}{dn}y(0) + \frac{1}{n^2}y(0) - \frac{d}{dn}y'(0) - p\frac{d}{dn}S\{y\} - S\{y\} + \frac{1}{n^2}y(0) - \frac{1}{n^2}y(0) -$ $\frac{d}{dn}y(0) - S\{y\} = 0$ $\Rightarrow \frac{d}{dn} S\{y\}[1-p] - 2S\{y\} = 0$ $\frac{d S\{y\}}{S\{y\}} = \frac{2}{1-p} dp \quad \Rightarrow S\{y\} = \frac{C}{(1-p)^2}.$ By applying inverse Sawi transform, we get: $y = S^{-1}\left\{\frac{c}{(1-p)^2}\right\} \Rightarrow y = Cte^t.$ $\because y'(0) = 2 \implies C = 2 \qquad \implies \qquad y = 2te^t.$ Example (2): Solve the differential equation: ty'' + (1 - 2t)y' - 2y = 0,with [v(0) = 1 & v'(0) = 2]. Solution: Taking the Sawi transform of given equation to give us: $S\{ty''\} + S\{(1-2t)y'\} - 2S\{y\} = 0$ $\frac{d}{dn}S\{y\} - \frac{1}{n}\frac{d}{dn}y(0) + \frac{1}{n^2}y(0) - \frac{d}{dn}y'(0) + \frac{1}{n}S\{y\} - \frac{1}{n^2}y(0) - \frac{d}{n^2}y'(0) - \frac{1}{n^2}y(0) - \frac{1}{n^2$ $2\left[p\frac{d}{dn}S\{y\} + S\{y\} - \frac{d}{dn}y(0)\right] - 2S\{y\} = 0$ $\Rightarrow \frac{d}{dn} S\{y\} [1-2p] + S\{y\} \left[\frac{1}{n} - 4\right] = 0.$ Let $R = S\{y\}$ $\Rightarrow \frac{dR}{dp} = -\frac{4p-1}{2p^2-p}R \Rightarrow \frac{dR}{R} = -\frac{4p-1}{2p^2-p} \Rightarrow R = \frac{c}{p(1-2p)} \equiv S\{y\} = \frac{c}{p(1-2p)}.$ Now applying inverse Sawi transform, we get $y = S^{-1}\left\{\frac{c}{n(1-2n)}\right\} \Rightarrow y = \frac{c}{2}e^{2t}.$ $\therefore y(0) = 1 \implies 1 = \frac{c}{2} \implies c = 2 \implies y = e^{2t}.$ Example (3): Solve the differential equation: $tv'' + v' = 4t^2$ with the initial condition y(0) = 1 & y'(0) = 0. Solution: Applying the Sawi transform to both sides of the given equation, we get: $S{ty''} + S{y'} = 4S{t^2}$ $\frac{d}{dn}S\{y\} - \frac{1}{n}\frac{d}{dn}y(0) + \frac{1}{n^2}y(0) - \frac{d}{dn}y'(0) + \frac{1}{p}S\{y\} - \frac{1}{p^2}y(0) = 8p$ $\Rightarrow \frac{d}{dp}S\{y\} + \frac{1}{p}S\{y\} = 8p , \qquad \text{suppose } R = S\{y\}$

 $\therefore \frac{dR}{dp} + \frac{1}{p}R = 8p$

which is a linear differential equation and it has the integrative factor: $\lambda = p.$ $\Rightarrow R = \frac{8p^2}{2} + \frac{c}{n}$ $\Rightarrow S\{y\} = \frac{8p^2}{3} + \frac{c}{n}.$ By apply inverse Sawi transform to both sides of last equation, we get $y = S^{-1}\left\{\frac{8p^2}{2}\right\} + cS^{-1}\left\{\frac{1}{n}\right\} \Rightarrow \qquad y = \frac{4t^3}{9} + c.$ $\therefore y(0) = 1 \Rightarrow 1 = 0 + c \Rightarrow c = 1 \Rightarrow y = \frac{4t^3}{2} + 1.$ Example (4): Solve the differential equation: $t^2 y'' - 4ty' + 4y = 0$ with [y(0) = 0 & y'(0) = 1]. Solution: Taking the Sawi transform of given equation to give us: $S\{t^2y''\} - 4S\{ty'\} + 4S\{y\} = 0$ $p^{2} \frac{d^{2}}{dn^{2}} S\{y\} + 2p \frac{d}{dn} S\{y\} - p^{2} \frac{d^{2}}{dn^{2}} y'(0) - 2p \frac{d}{dn} y'(0) - p \frac{d^{2}}{dn^{2}} y(0) - p \frac{d^{2}}{dn^{2}} y$ $4\left[p\frac{d}{dn}S\{y\} + S\{y\} - \frac{d}{dn}y(0)\right] + 4S\{y\} = 0$ $p^2 \frac{d^2}{dn^2} S\{y\} - 2p \frac{d}{dn} S\{y\} = 0.$ Assume $R = S\{y\}$ and then let $W = \frac{dR}{dn}$, so we get $\Rightarrow \frac{dW}{dp} = \frac{2W}{p} \Rightarrow \frac{dW}{W} = 2\frac{dp}{p} \Rightarrow W = c_1 p^2 \Rightarrow \frac{dR}{dp} = c_1 p^2 \Rightarrow R = \frac{c_1 p^3}{3} + c_2$ $\Rightarrow S\{y\} = \frac{c_1 p^3}{3} + c_2.$ Then apply inverse Sawi transform, we get $y = \frac{c_1}{3}S^{-1}\{p^3\} + c_2S^{-1}\{1\} \Rightarrow y = \frac{c_1t^4}{34!} + c_2t, \ let \ y = Ct^4 + c_2t; \ C = Ct^4 + c_2t$ $\frac{c_1}{72}$ $\stackrel{^{\prime}2}{::} y'(0) = 1 \implies c_2 = 1 \implies y = Ct^4 + t.$

Conclusion: In this paper, authors successfully discussed the application of Sawi transform for solving ODE's with variable coefficients by giving four numerical problems. The results of numerical problems show that the Sawi transform is very useful integral transform for solving such equations. At last, all the obtained solutions of the indicated numerical problems are satisfied by putting them back in the corresponding equations. In future, Sawi transform can be used for solving a wide class of similar equations.
